Unlimited Finance Litepaper 2022

By Professor CP

Contents:

Introduction
Unlimited Finance is the first Ai staking protocol of its kind, it was created based on the concept of managed funds and automated artificial intelligence capitalising on the volatility of the crypto market generating profit per transaction in a variety of assets that have shown strength throughout years.

The original concept was developed by a financial advisor (Joe L.) and a blockchain developer (Professor CP) after crossing paths in a business venture they decided to create a team and tokenise their idea, having an established business in Auckland, New Zealand.

After approaching several local companies the willingness to invest coming from every single one of these companies was overwhelming as today more than ever people are walking away from traditional investment schemes backed by national and international banks.

Unlimited Finance is more than just a token is the door to access a new blockchain with a completely revolutionising concept that will benefit every single investor holding the UNLIMITED token, with a launchpad and the most beneficial staking concept seen currently in the crypto world.

Ai Protocol

Unlimited Finance Ai Protocol connects to multiple exchanges using the liquidity provided by local companies and external funding allocated to back the project's liquidity inside a vault called the Unlimited Treasury the funds are always stored in 5 different cryptocurrencies: BNB, BUSD, USDT, ETH and BTC.

The Ai Protocol makes up to 15 transactions per hour, using an automated method known as scalping, all the profits are taken daily by the protocol and allocated to the staking pools so every single holder staking will enjoy the rewards daily.

The protocol has been tested for several months with an impressive success rate even in a declining market the team has been able to remain profitable regardless of the direction of the market and that is where the success of unlimited finance comes from as the scalping method can generate profits when the market goes up or down.

Staking Rewards

The team at Unlimited Finance has selected the following cryptocurrencies as the main drivers of the profits generated by the staking protocol: BNB, BUSD, USDT, ETH, and BTC.

The concept has been formulated to avoid causing any negative impact within the project; multiple projects reward their token or stable coins that are generated by selling their token this creates red candles that alert new investors, and the more that people buy these kinds of projects, the more that they need to rewards and sell ultimately killing the project.

After analysing multiple projects, the decision was made by the team to have a proprietary treasury fund that will utilise the assets saved in it to generate profit rewarded in a daily and consistent manner to any token holder; the way that the rewards are generated will not affect the growth negatively as their business model generates the profits with active liquidity locked inside the treasury fund.
Pools

First, participants pledge their coins to the cryptocurrency protocol. From those participants, the protocol chooses validators to confirm blocks of transactions. The more coins you pledge, the more likely you are to be chosen as a validator.

Every time a block is added to the blockchain, new cryptocurrency coins are minted and distributed as staking rewards to that block's validator. In most cases, the rewards are the same type of cryptocurrency that participants are staking.

Proof of stake in crypto is a consensus mechanism -- a way for a blockchain to validate transactions. The nodes in a blockchain must be in agreement on the present state of the blockchain and which transactions are valid.

There are different consensus mechanisms that cryptocurrencies use. Proof of stake is one of the most popular for its efficiency and because participants can earn rewards on the crypto they stake.

Staking rewards are an incentive that blockchains provide to participants. Each blockchain has a set amount of crypto rewards for validating a block of transactions. When you stake crypto and you're chosen to validate transactions, you receive those crypto rewards.

Benefits of staking crypto

Here are the benefits of cryptocurrency staking:

- It's an easy way to earn interest on your cryptocurrency holdings.
- You don't need any equipment for crypto staking like you would for crypto mining.
- You're helping to maintain the security and efficiency of the blockchain.
- It's more environmentally friendly than crypto mining.

Next Steps(Launchpad)
The team's idea is to help new crypto investors and companies within their database to be more informed about new projects and the potential risks of investing in new projects, as the unlimited finance has unlimited benefits, the team have created an automated Ai method to run tests within new projects seeking liquidity to launch their project.

The Launchpad will give access to token stakers to presales allocations, private sales and much more.

Every project promoted through the Unlimited Finance launchpad will be audited and KYC'ed to guarantee the safety of the new investor's funds, a project that will allow you to invest in upcoming projects before they are launched on DX Sale and Pinksale.

All the fees generated will be allocated to the research and development of the Infinity blockchain project, the participants will receive a number of points, over the months the points accumulated will dictate the allocation of coins once the blockchain is launched.

Audit

Infinity Blockchain

Infinity blockchain will be developed using the Cosmos SDK, The goal of the Cosmos SDK is to allow developers to easily create custom blockchains from scratch that can natively interoperate with other blockchains. We envision the Cosmos SDK as the npm-like framework to build secure blockchain applications on top of tendermint.

Having a highly scalable and fast blockchain that will be powered 100% by clean energy will be something remarkable and needed due to the number of transactions processed per second, with native tools to create smart contracts and multiple options to generate passive income and the first blockchain-backed by stable assets, with the main purpose of helping the environment, allowing decentralised freedom and making the development of new projects a breeze with the Unlimited Incubators Program.

The blockchain has been in development since August 2021 and the expected launch date is planned for December 2022, for more updates keep checking the Unlimited Finance discord and telegram.
